

Manage token vesting without smart contracts using Liquifi and Safe multi-sig wallets.

Increase the security of token transfers.

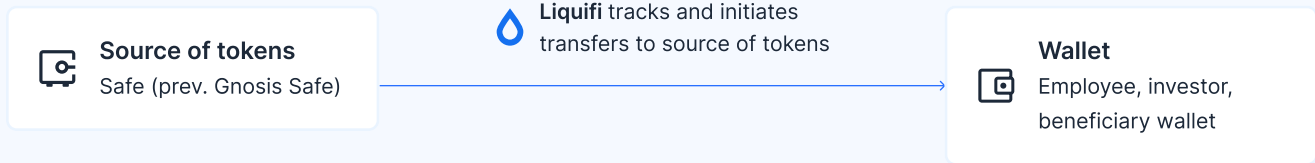

Save on token transfer gas fees with bulk transaction processing.

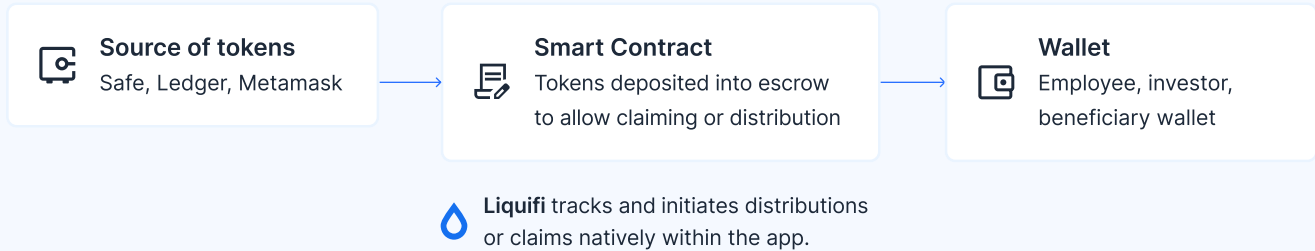

minimize transaction signatures and schedule future payouts.

LIQUIFI OFFERS BOTH OPTIONS

WALLET TO WALLET

WITH SMART CONTRACT

HOW DOES IT WORK?

Connect your Safe multi-sig to Liquifi's platform to track all vesting schedules and payouts. Once payouts are initiated, Liquifi queues up payouts into their Safe account for review and signature before tokens get sent to the beneficiary's wallet. With this option, teams now have the ability to bypass the use of a smart contract in order to distribute tokens. Teams will still have the option to utilize Liquifi's smart contract to distribute or allow claiming natively in the platform.
